

Vektor Roadmap: From Current Alpha to Final Local + Vendor + Free-VM + Vercel System

Target architecture: CEO controls Vektor through OpenClaw/Discord, backend workers run on a persistent free VM, hosted LLM vendors power the swarm, public surfaces ship through Vercel, and every decision, deliverable, trade, and approval is fully traceable.

PHASE ALPHA PROGRESS

79 / 100

Backend core is strong. Main gaps are multi-day soak, VM hardening, deeper scanner/ML/risk completion, and operator polish.

ALPHA EXIT RULE

Stable Local First

No VM deployment should be treated as real until Vektor survives a 48-72h local soak with clean recovery, approvals, and no queue/runtime drift.

ALPHA REMAINING CHECKLIST

- Run a 48-72 hour local soak with logged queue depth, provider throttling, retries, restart recovery, and stale-task checks.
- Finish discovery pipeline quality: dedicated scanners, ranking, pruning, wave scheduling, and explicit sit-in-cash behavior.
- Complete ML as a first-class gate: regression, classification, regime detection, confidence estimation, and empirical threshold tuning from outcomes.
- Finish risk as a hard gatekeeper: asset-specific caps, correlated exposure, event-risk control, thesis invalidation lifecycle, and post-trade review hooks.
- Complete CEO control: scheduled digests, permission workflow for trades/allocation/publication/reroutes, and mature Discord help/command grammar.
- Harden multi-asset support: current paper routes are real, but venue-grade live adapters and operational runbooks still need proof.

ALPHA

Backend Fund OS

BUILD

- Canonical Vektor/OpenClaw CEO layer over backend workers
- Hosted multi-vendor LLM routing, budgeting, cooldowns, and retries
- Sequential + parallel swarms, approvals, audit trail, strict real-data mode
- Paper execution across equities, options, forex, crypto with policy gates

VEKTOR CAN DO AFTER PHASE

- Brief CEO, request permissions, orchestrate swarms, and paper-trade safely
- Explain positions, winners/losers, exposure, approvals, and risk alerts

BETA

Data, KB, and Traceability

BUILD

- Durable SQL-first artifact store for every report, task, decision, approval, and model output
- Document IDs, lineage, retrieval, graph views, and KB promotion workflow
- Structured ML input/output storage and reusable research memory

VEKTOR CAN DO AFTER PHASE

- Answer with provenance, show what each agent found, who used it, and what it changed
- Use past work as fund memory rather than stateless task output

GAMMA

Operator Console and CRM

BUILD

- Dense admin console with live agent process views, staged waves, pending approvals, digests, and market watch
- Role-based workflow around CEO review, intervention, and audit
- Remove duplicate tabs and make each surface operationally distinct

VEKTOR CAN DO AFTER PHASE

- Operate like a real desk: monitor, explain, approve, reroute, cancel, and recover from one control plane

DELTA

Research and Publication Engine

BUILD

- Internal-only by default, explicit promotion to public research/blog
- Editorial approval flow, market briefs, research papers, and readable institutional output
- 'blog-next' and research surfaces fed from approved backend content only

VEKTOR CAN DO AFTER PHASE

- Produce credible research and editorial output that is approval-gated before publication

EPSILON

Persistent Infra and Deployment

BUILD

- Backend on a free persistent VM with static IP, supervised startup, reboot recovery, logs, health checks, and backups
- OpenClaw stays on laptop as CEO interface
- Public landing/blog/research/admin-friendly surfaces deployed on Vercel

VEKTOR CAN DO AFTER PHASE

- Run 24/7 in paper mode remotely while CEO still controls it locally through Discord/OpenClaw

ZETA

Final Operating Standard

BUILD

- Investor-grade reporting, security hardening, compliance prep, and measurable track record exports
- Vendor abstraction ready for stronger paid data/LLMs without architecture rewrite
- Outcome feedback loops for model/risk tuning

VEKTOR CAN DO AFTER PHASE

- Act as a local-first, vendor-backed, remotely hosted, operator-controlled hedge fund OS with auditable memory and publishable outputs

Final Version of Vektor

- CEO speaks to Vektor naturally through OpenClaw/Discord, not backend endpoints.
- Backend workers and schedulers run continuously on a free VM with hosted LLM vendors.
- Admin is the internal CRM/war-room; Vercel hosts the public landing, blog, and research surfaces.
- Every trade, approval, model score, report, and publication has traceable lineage.
- Vektor can discover, rank, reject, approve, and paper-execute across asset classes with clear no-trade behavior.

STRICT BUILD ORDER

- **Now:** finish Alpha reliability and local operating quality.
- **Then:** move to Beta/Gamma only where it strengthens operational traceability and control.
- **Then:** public publication surfaces and Vercel distribution from approved internal outputs.
- **Then:** free VM persistence and 24/7 paper-mode remote operation.
- **Finally:** investor/compliance-grade hardening and paid vendor upgrades.

Pragmatic rule: do not skip unresolved Alpha reliability gaps by hiding them in cloud deployment or frontend work. The correct sequence is local proof -> persistent VM -> public polish -> externalization.
